CeEst ERP

LIVE DEMONSTRATION

One operating record.

Complete estate control.

Property management, facilities operations and staff performance—connected from transaction to report.

RECORD → ACT → VERIFY → REPORT

Live demonstration • August 2026

DEMO STORY

From property record to management evidence

A focused 25–30 minute journey—not a tour of every menu.

01 RECORD

Property, tenant, asset and service masters

02 PLAN

Billing schedules, PPM and compliance calendars

03 EXECUTE

Tasks, tickets, work orders and collections

04 VERIFY

Approvals, evidence, SLA and audit trail

05 MEASURE

KPIs, trends, ageing and performance

06 REPORT

Tenant, manager and landlord outputs

PROOF **Every dashboard number is traceable to an underlying transaction and responsible person.**

COMMAND CENTRE

Start with today’s operating priorities

Companion gives each manager one place to see what needs attention now.

Due today

Planned maintenance, inspections, lease events and assigned tasks.

Needs attention

Overdue actions, SLA risks, expiring compliance and approvals.

Team delivery

Assignments, progress, evidence and staff performance.

Quartermaster AI

Contextual assistance, summaries and operational guidance.

- Open with the manager’s current property already selected.
- Use one alert as the bridge into the live workflow.
- Return here at the end to show the action is now reflected.

PROOF **The ERP behaves as an operating command centre, not a passive database.**

PROPERTY FOUNDATION

A complete, property-scoped operating record

Property → buildings/areas → units → tenants → services → assets.

Property & buildings

Identity, address, ownership, building hierarchy, lettable area, utilities, documents and contacts.

Units & billing schedule

Unit use, floor, area, parking, recurring charges, deposits and utility applicability.

Tenant & lease

Application, contacts, assigned unit, commencement, expiry, escalation and approvals.

All module tabs inherit the selected property—no portfolio totals inside a property workspace.

PROOF **One trusted structure eliminates duplicate setup and enables automatic downstream billing and reporting.**

PROPERTY MANAGEMENT

Tenancy and billing are configured once

The unit defines what can be billed; the lease defines when rent becomes due.

1 Configure the unit

Rent basis, service charge, utilities, parking and deposits belong to the unit billing schedule.

2 Create the tenancy

Select the unit, capture lease dates and escalation, then inherit applicable charges automatically.

3 Generate invoices

The engine checks readiness and produces separate rent and utility invoices—payable together.

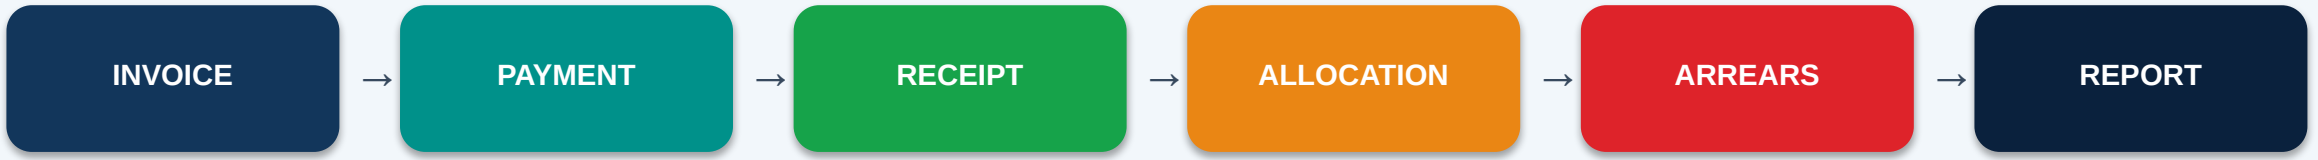

Demo action: open one active tenant and explain the source of each charge before opening invoicing.

PROOF **Billing is driven by tenancy and unit data—not rebuilt manually at month-end.**

COLLECTIONS

From invoice to receipt, allocation and arrears

A clear financial trail for manager, landlord and tenant.

- Show billed, collected and outstanding for the selected property and period.
- Open the tenant statement or receipt to prove document quality and traceability.
- Explain reminders and recovery actions without overstating unconfigured payment integrations.

PROOF **The manager can explain every balance and the tenant can access the same supporting documents.**

SERVICE CHARGE

Plan, allocate, reconcile and explain

Connect operational requirements to the annual service charge budget.

1 Schemes

Define period, allocation basis and applicable units.

2 Budget lines

Security, cleaning, utilities, repairs and management costs.

3 Allocation

Apportion by area, equal share or configured driver.

4 Reconciliation

Compare budget with actual expenditure and explain variance.

Use historical averages or projected quantities and rates—then preserve the approval and audit trail.

PROOF **Service charge planning is linked to real operational requirements and actual expenditure.**

TENANT SELF-SERVICE

A tenant can act—not only view

Invoices, receipts, lease information, notices and maintenance requests in one secure portal.

₭ Financial self-service

View invoices, balances, receipts and payment history.

! Report an issue

Capture category, priority, description and unit context; receive a traceable reference.

✓ Track progress

See open requests, updates, documents and closure evidence.

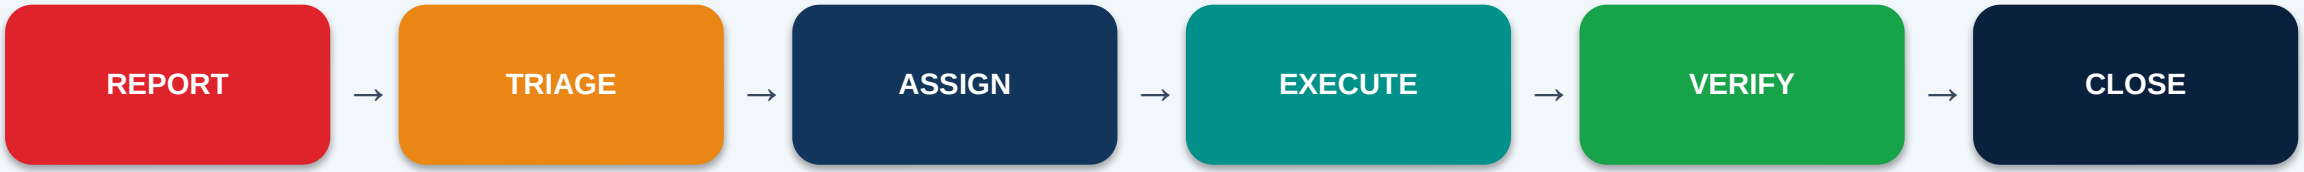

Live proof: submit a low-risk issue, note the reference, then continue the same record in Facility Management.

PROOF **A tenant request becomes a property-scoped operational transaction—not an email or informal phone call.**

FACILITIES OPERATIONS

Turn a reported defect into controlled work

Ticket → triage → SLA → assignment → evidence → verification → closure.

- Time-stamped severity and SLA target
- Responsible staff member or approved service provider
- Photos, notes, costs and verification evidence
- Escalation and notifications when thresholds are at risk

PROOF **Every maintenance action has ownership, evidence, elapsed time and a measurable outcome.**

ASSET LIFECYCLE

Every critical asset has a passport and a plan

From onboarding to preventive maintenance, condition history and replacement decisions.

- Specification, location, condition, criticality and warranty
- Service history, documents and next planned maintenance
- 12-month PPM calendar with due, completed and overdue work
- Inspections, compliance renewals and recurring-failure visibility

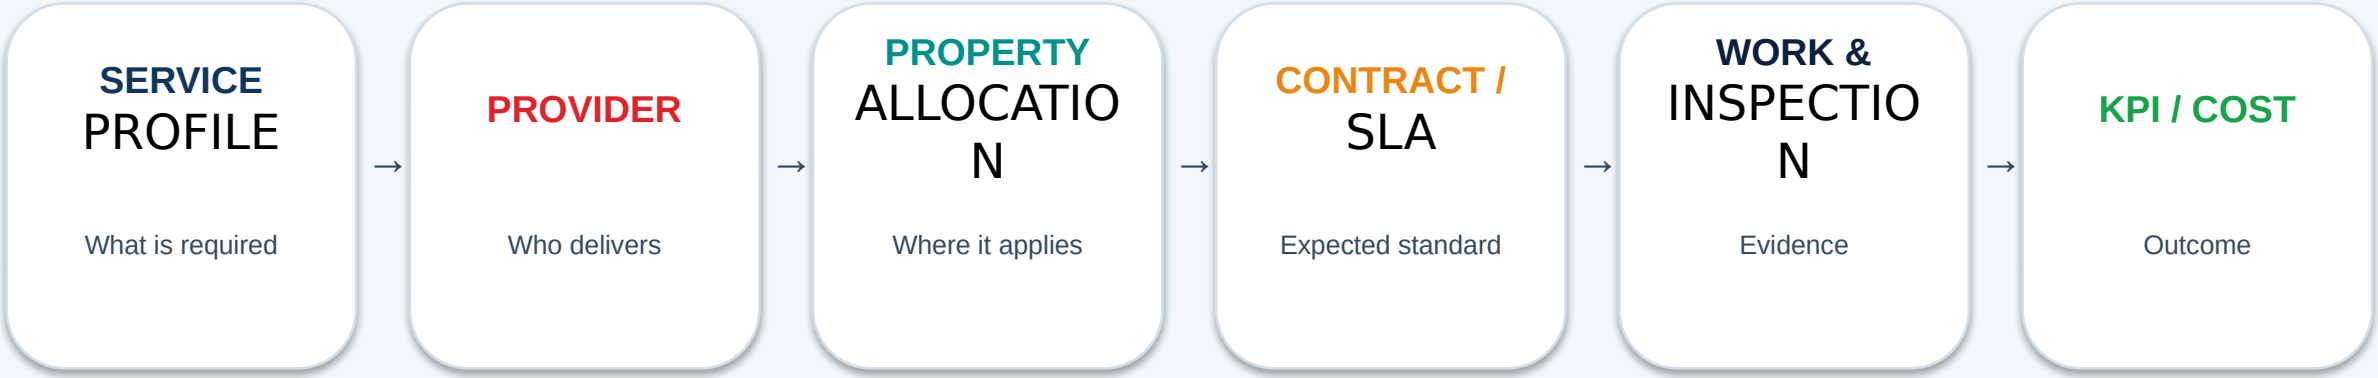

PROOF **The asset register is operational: it drives schedules, work, compliance and lifecycle decisions.**

SERVICE ARCHITECTURE

Define WHAT before assigning WHO

Service Profiles remain stable while providers, contracts and performance can change.

- One profile can use different providers at different properties.
- Changing a provider must never erase service requirements or historical performance.

PROOF **Provider selection is separated from the enduring service standard used for SLA and KPI measurement.**

PERFORMANCE

Transactions become management insight

Use trends and exceptions to answer: What happened? Why? What needs action next?

✓ PPM compliance

Completed on time, overdue and upcoming preventive work.

◷ SLA performance

Response and resolution time by priority, team and provider.

↗ Financial control

Expected vs actual collections, arrears ageing and budget variance.

! Risk & compliance

Expiries, incidents, recurring defects and approvals.

Drill from every metric to the source record during the demo.

PROOF **The system measures performance objectively using the same records created during daily work.**

REPORTING

One data source, different audiences

Operational registers, tenant documents and landlord-ready management packs.

Operational

Work orders, PPM, compliance, incidents, utilities and provider performance.

Financial

Billing and collection, receipts and expenditure, arrears, VAT and budget versus actual.

Tenancy

Occupancy, vacancy, lease expiry, movements and tenant statements.

- PDF for presentation and audit evidence
- Excel/CSV for analysis and downstream processing
- Property, reporting period, management identity and branding in every document

PROOF **Management and landlord reports reuse live records instead of separate spreadsheets.**

LIVE DEMONSTRATION

Recommended 27-minute run of show

Keep the audience inside one property and one coherent story.

2 min	**Companion**	Today’s priorities and selected property
4 min	**Property & tenancy**	Unit billing schedule and active lease
4 min	**Billing & collections**	Invoice source, receipt and outstanding balance
3 min	**Tenant portal**	Submit one maintenance issue
6 min	**Facility workflow**	Triage, SLA, assignment, evidence and verification
3 min	**Asset & PPM**	Asset passport, calendar and compliance
3 min	**Performance & reports**	KPI drill-down and landlord output
2 min	**Close**	Return to Companion and recap proof chain

PROOF **Perform one meaningful action live; use prepared records for the broader lifecycle and reporting story.**

PRESENTER GUARDRAILS

What to claim—and what to position as roadmap

Credibility matters more than covering every feature.

✓ Show live

Property scoping, tenant/lease records, issue reporting, work orders, PPM, service profiles/providers, reports and Companion workflows.

! Describe carefully

External email/SMS delivery, live payment gateways and scheduled automations only when the environment is configured and tested.

→ Position as integration

Specific smart-meter devices, third-party accounting systems and provider-specific APIs require vendor credentials and interface work.

PROOF **Never claim a feature is live unless it works in the environment being demonstrated.**

DEMO READINESS

Final pre-flight checklist

Run this on the same device, browser and network that will be used in the meeting.

- ☐ Login and session persistence
- ☐ Correct organization and selected property
- ☐ Property, tenant, asset and provider records populated
- ☐ Open, due and overdue work represented
- ☐ Tenant issue submission and generated reference
- ☐ Work-order detail and SLA fields
- ☐ PPM and compliance calendar
- ☐ Companion tasks and notifications
- ☐ PDF report opens and is legible
- ☐ Backup screenshots/video available

PROOF Stop and switch to the backup path if latency, authentication or integrations are unstable.

CLOSE

CeEst is an operating control system

A single live record connects tenants, staff, providers, assets, money and management evidence.

RECORD → PLAN → ASSIGN → EXECUTE → VERIFY → MEASURE → REPORT → IMPROVE

The facility is onboarded. Work is planned. Issues are controlled. Performance is measured. Reports are ready.

Questions & live scenarios

PROOF One operating record. Complete estate control.
